closed (30 November 2022)

Message from the Guest Editor

Dear Colleagues,

The Special Issue is focused on the processing of organic and inorganic polymers using supercritical fluids. This includes drying, foaming, impregnation, deposition, and extrusion of polymers using supercritical fluids for the preparation of different forms such as films, fibers, foams, scaffolds, aerogels, etc. The addition of organic compounds and inorganic nanoparticles to polymers using supercritical fluids is welcomed to broaden the number of polymer applications that include, but are not limited to food, pharmacy, medicine, textile, environment, acoustic, electric, etc.
